

Standard Color Chart

SoyCrete stain colors shown above represent standard colors on standard gray concrete surfaces. Natural variations are created through the natural density and porosity of the concrete. This chart is used for color representation only, as actual colors will vary depending on surface porosity, texture, and color. Enhanced variations in shades or tones may be accomplished through easy application techniques. Wipe with water to lighten, add additional coat to darken or additional colors for accents, etc. Custom color shades are available as well as a base tint formula for the experienced designer. To achieve greater topcoat consistency over varied substrate textures or color variation, use a white base coat or simply apply additional coats. A white base coat also provides a beautiful contrast when used in combination with decorative finishing techniques.
